

Security Alert: Recent Phishing Trends Targeting Our Team

Team,

As part of our ongoing effort to keep our data and our customers' information secure, I want to highlight three specific types of “phishing” emails I have intercepted this week.

These emails are becoming more sophisticated and are designed to look like routine business requests or internal IT notifications. Please be on the lookout for the following:

1. The “Look-Alike” Domain

- The Tactic: You might get a rate request from a familiar company, but the email address is slightly off (e.g. careerstextron.com instead of textron.com)
- What to do: Always double-check the sender's domain name before replying with sensitive pricing or company information.

2. The “Official” Service Hijack

- The Tactic: Emails that say “Authorized Transmission” or “Internal Dispatch.” These often bypass filters because they are sent through legitimate services like SendGrid.
- What to do: If you weren't expecting a file or a dispatch notice, treat it with caution even if it doesn't look like “spam.”

3. The Fake “IT Security Desk”

- The Tactic: An email claiming there is an issue with your Google Workspace Password.
- The Trap: These often come from hijacked accounts at other companies. They want you to click a link and enter your password on a fake login page.
- What to do: Our IT department will never ask for your password via email. If you are prompted to “verify” your account, go directly to your browser and log in at accounts.google.com rather than clicking the link in the email.

Pro-Tip: If you are ever unsure about an email, feel free to reach out to me or the IT team. It is always better to spend 30 seconds verifying an email than 3 days to recover from a security breach!

Best regards,

Sam Dickison
Security Liaison
